Scrum Meeting Minutes

Project: Road to GM
Date: Feb 24, 2026
Duration: 1 hour
Attendees: Raquel & Jasey

Yellow ->Due Date/ In Progress

Red-> Backlog

Green -> Done

---

1. Progress

- Project initialized using Vite + React.

- Installed react-chessboard and chess.js.

- Basic Express and REACT server created. (Build application de React and Express serves the React application to the user) (During development we run both)
- Docker for now, still a possibility to use Mongo DB (it has good integration with REACT)
- Initial database design started.
- Express only handling API calls, no rendering (since we are not using EJS, and its also not requirement) {We can test express and react por separado}

---

2. In Progress

Jasey's Feb 28:

- Checking how react-chessboard and chess.js work together in detail
- Set up database and dummy data

Raquel's Feb 28:

- UI, design board for Main page, Login Page, Training Page (ejercicio selected) ,Module page, Club pages
- Componentes de React

- API calls and routes -> Waiting on the UI design
- Defining module design
- Defining exercise structure.
- Connecting front to back

- Deciding between PostgreSQL, MongoDB and Docker.

---

3. Blockers

- Final database architecture decision.

- Initial Docker configuration.

---

4. Next Steps

- Implement basic authentication.

- Create main API endpoints.

- Test first functional version of chessboard connected to backend.
- Chess exercise creation -> UI + chess.js for faster validation, instead of waiting for API calls, it's like a preliminary validation (could be necessary for exercise creation)??

5. NOTES

- EJS - Embedded JavaScript Templates -> Tested them, but decided not to use them because we can do that more seamlessly with REACT
- Liveserver -> Created a simple server, but did not meet our requirements. Good for development but not for production
